

# 12 Tips **Guaranteed** to save you **Money, Time & the Environment** when buying a **Lawn Sprinkler System!**

- 1. SAVE MONEY** - Installing an efficient lawn sprinkler system guarantees you to have a **lower water bill** some months (up to 60%) and you may also be entitled to **discounts on home owners insurance**. (Restrictions may apply so be sure to check with your insurance carrier.)
- 2. SAVE TIME & EFFORT** - once your lawn sprinkler system is installed you'll never have to drag a hose all over the yard, never have to try and figure out if you've applied enough (or too much) water, and you'll never have to worry about watering the lawn while you're away.
- 3. SAVE THE ENVIRONMENT** - water more efficiently with eco-friendly products including Smart Timers, rain sensors, high efficient rotors and nozzles and controllers with water saving options.
- 4. SAVE WATER** - water wisely with a properly programmed efficiently timed sprinkler system.
- 5. Install a rain sensor** that will automatically shut your sprinkler system down in the event of rainfall and automatically allowing your system back on when the weather is dry.
- 6. Install a Hunter Solar Sync** that measures temperature and sunlight and automatically adjusts the duration of watering. The sprinkler systems will also act as a Freeze Sensor thereby preventing operation at 37 degrees and below.
- 7. Install a programmable controller** that will water precisely to the minute, easy to adjust, and allow for odd and even day watering.
- 8. Install sprinkler heads** that have matched precipitation nozzles which balance watering, provide uniform distribution of water and eliminate waste.
- 9. Install drip irrigation** for perimeter plantings, shrub plantings, and foundation plantings. Drip irrigation is highly efficient delivery system that supplies water at precisely the location where it is needed.
- 10. Connect a fertigation system** to your irrigation system as this will provide organic fertilizer and bio-nutrients to your plants and soil. Improving your soil with bionutrients will increase the health of your plants, increase the water holding capacity of the soil and reduce the amount of irrigation required.
- 11. Use best the equipment** available as this reduces costly service calls and replacements later.
- 12. Hire a Certified Irrigation Designer & Certified Irrigation Contractor** that knows the sprinkler codes, water companies, water pressure, plant material and turf requirements.
